The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cytochrome P450 used for improving the productivity of anticancer
                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes 3 Streptomyces cytochrome P450 (I) sequences, ABB81315 to ABB81317 encoded by ABN88910 to ABN88912 respectively. (I) have monoxygenesse activity and improve the productivity of an anticancer drug designated UCN-01. (I) is used for the production of UCN-01 with transformed Streptomyces Sp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Streptomyces; cytochrome P450; anticancer; UCN-01; monooxygenase;
                                                                                         Disclosure; SEQ ID NO 6189; 21pp + Sequence Listing; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                à
                                                                                                                                                                                                                                                                                                                                             The present sequence is from an antithrombin III (ATIII) variant, FF derived from human ATII.N135A cDNA insert of the pBlueBac baculovirus expression construct and comprises residues 385-393. The variant has improved resistance to elastase and IgG-activated neutrophils while retains anti-thrombin and anti-factor Xa activities. It may be compressed as glycoforms with enhanced heprin affinity which target the blood vessel wall more efficiently than ATIIs with normal heparin affinity. The modified ATIIs can be used to treat thrombin activational related pathological symptoms due to sepsis, trauma, acute respiratory distress syndrome, restenosis, thrombosis, thromboembolism and stroke. It can also be used to reduce the risk of reocclusion and restenosis in percutaneous transluminal coronary angioplasty, intrombosis associated with surgery, ischaemia/Feperfusion injury, and coagulation abnormalities in cancer or surgical patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                          New modified human antithrombin III compounds, used for treating e.g. sepsis, trauma, acute respiratory distress syndrome, restenosis, thrombosis, thromboembolism or stroke -

submitted (May-1996) to the EMBL/Genbank/DDBJ databases.
-!- PUNCTION: LINBAGE-SPECIFIC CYTOKINE AFFECTING THE PROLIFERATION
AND MATURATION OF MEGAKARYOCYTES FROM THEIR COMMITTED PROGENITOR
CELLS. IT ACTS AT A LATE STAGE OF MEGAKARYOCYTE DEVELOPMENT. IT
MAY BE THE MAJOR PHYSIOLOGICAL REGULATOR OF CIRCULATING PLATELETS.
-!- SUBCELLULAR LOCATION: Secreted.

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hematopoiseis regulating activity, tissue growth factor activity, immnomodulatory activity and activity and activity and activity and activity and activity and activity activity and activity activity and activity and activity and activity activity and activity activity and activity activity and activity activity activity and activity activity and activity activit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptida therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
denatures PrPSc thereby providing a means of differentiating levels
                          of PrpC and PrPC+PrPSc in a sample. The invention also provides a therapeutic antibody which prevents or treats prion disease in ungulates, and specifically in cattle, and a means for certifying certain products as being prion free.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukaemia, inflammation and immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 20; SEQ ID NO 25814; 1399pp + Sequence Listing; English.

The invention relates to isolated polynuclectide (I) and probes, collypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (FCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (III). The collymerase chair reserved sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques or restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving containtating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cand to produce other types of dentification of mutations and to produce other types of dentification of mutations and to produce other types of the invention.

CC and to produce other types of the invention.

CC and to produce other types of the invention.

CC and the sequence data for this patent din of appear in the printed specification, but was obtained in electronic format directly from MIPO cc at ftp.wipo.int/pub/published_pot_sequences.

PA is implicated in haemostatis, tissue repair, metastasis formation, ovulation, fertility, macrophage migration
serpin does not inhibit activated protein C (aPC), does not require activation by heparin, and includes a target sequence which interacts with the proteolytically active site of thrombin to inhibit its activity. The inhibitor protein can be used as antithrombotic, or anticoagulant agents for treating or preventing disseminated intravascular coagulation (DIC), unstable angina, myocardial infarction, thrombotic stroke, thrombosis, pulmonary embolism, or other clotting disorders. When this protein is labelled, it can be used in diagnostic assays to determine the presence of serine proteases, especially thrombolin. The protein has the same specificity as AT-III, but does not need to be administered with heparin, and is approximately 1500 times
                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New DNA sequence encoding plasminogen activator inhibitor type ; and derived proteins and antibodies, useful therapeutically and

The DNA sequences were isolated from Streptococcus pneumoniae strain of the DNA sequences were isolated from Streptococcus pneumoniae strain of the only of NoIMB 40794). The Streptococcus pneumoniae proteins of the inhibit or activate the activity of the proteins. Antagonists can be used to treat diseases caused by S. pneumoniae proteins, through genetic immunisation. They can also be used to induce an immunological response in a mammal by inoculation with the S. pneumoniae proteins or delivery of the encoding nucleic acids in a vector adequate to produce antibody and/or T cell immune responses to protect the animal from disease. The proteins can also be used to identify antimicrobial compounds which are capable of inhibiting their bloactivity. In particular the proteins of the invention can be used to prevent adhesion of bacteria to mammalian carracellular matrix proteins on in-dwalling devices or in wounds, to block protein-mediated mammalian cell invasion, and to block the normal profession of pathogenesis in infections initiated other hand by the contractions of interest of the brother mediated mammalian surventions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a protein comprising or having at least 50% identify to any of the 2469 amino acid sequences, identified in the specification (available on a computer redable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the streptococcus pneumoniae type 4 strain genomic sequence appearing as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media
function, and is encoded by a DNA sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                             implantation of in-dwelling devices or other surgical techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bacterial meningitis; pneumonia; sepsis; otitis media; ear infection; antiinflammatory; antibacterial; immunostimulant; auditory; respiratory; gene therapy; vaccine.

    pneumoniae type 4 strain protein from coding region #1529.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 31, DB 19; Length 110;

                                                                                                                                                                                                                                                                                    The present invention provides the protein and coding sequences of a number of human digestive system antigens. These can be used in the diagnosis, treatment and prevention of digestive system disorders, including cancer, Meckel's diverticulum, bacterial or parasitic infections, appendictis, Hirschsprung's disease, chronic colitis or ulcerative colitis. The present sequence is a digestive system antigen of

Interacts specifically with the W box (5'-(T)TGAC(C/T)-3'), a frequently occurring elicitor-sesponsive dis-acting element (By similarity).
SUBCELLULAR LOCATION: Nuclear (Potential).
SIMILARITY: Contains 2 WRKY domains.
                                                                                                                                                                                                                                      WRESE ARATH STANDARD; PRT; 423 AA.

30-MAY-2000 (Rel. 39, Last sanotation update)
Pesticidial crystal protein crylJa (Insecticidal delta-endotoxin crylJa (Insecticidal delta-endotoxin CrylJa)
CrylJa) (Crystaline entomocidal protoxin) (133 kDa crystal protein)
Bacillus thuringiensis.
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SUMILARITY: Belongs to the phenylalanyl-tRNA synthetase beta chain family. Subfamily 1.
-!- SIMILARITY: Contains 1 tRNA-binding domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PROSITE; PS50886; TRBD; 1.
Aminoacyl-tRNA synthetase; Protein biosynthesis; Ligase; ATP-binding;

There are no restrictions on its most by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch). DESCRIPTION 185:2330-2337 (2003).

-1- FUNCTION: ESSENTIAL FOR PROTIED EXPORT (BY SIMILARILY).

-1- SUBUNIT: ESSENTIAL FOR PROTIED FORDER TRANSLOCATION APPRARATUS.

-1- SUBUNIT: EART OF THE PROKRAYOTIC PROTIED TRANSLOCATION APPRARATUS.

WHICH COMPRISE SECA, SECB, SECB, SECF, SECF, SECR AND SECY. THE TRANSLOCATION CHANNEL SEEMS TO BE COMPSIGED OF A SECA HOMODINER AND FOUR COPIES OF A SECYEC COMPLEX (BY SIMILARILY).

-1- SUBCELLULAR LOCATION: Integral membrane protein. Inner membrane SEQUENCE FROM N.A.

The present sequence is from an antithrombin III (ATIII) variant, Aa derived from human ATII.N135A cDNA insert of the pBlueBac baculovirus expression construct and comprises residues 185-193. The variant has expression construct and comprises residues 185-193. The variant has improved resistance to elastase and IgG-activated neutrophils while retains anti-thrombin and anti-factor Xa activities. It may be expressed as glycoforms with enhanced heparin affinity which target the blood vessel wall more efficiently than ATIIIs with normal heparin affinity. The modified ATIIIs can be used to treat thrombin activation-respiratory distress syndrome, restences, trauma, acute and activation and stroke. It can also be used to reduce the risk of reocclusion and restences in percutaneous transluminal coronary angioplasty, and restencial associated with surgery, ischaemia/reperfusion injury, and coagulation abnormalities in cancer or surgical patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, cytokine; cell proliferation, cell differentiation, gene therapy, vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.

The invention relates to human polynucleotides (AA179941-AA193841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to sytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activiting and treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                               Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; secreted protein, EST; expressed sequence tag; diagnosis; forensic; gene therapy; chromosome mapping; signal peptide; upstream regulatory sequence; cytokine activity; cell proliferation; differentiation; haematopoiesis regulation; tissue growth regulation; reproductive hormone regulation; chemotactic; chemokinetic; haemostatic; thrombolytic; anti-inflammatory; tumour inhibition.

polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. AAPI6506 to AAPI6514 to AAB57303 represent sequences used in the exemplification of the present

The present invention relates to a new intracellular signalling molecule (INYSIG) polypeptide. The polypeptides and polymucleotides of the invention are useful in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of INYSIG, such as cell proliferative diseases (e.g. cancer, cancer, succimmune/inflammatory diseases (e.g. AIDS (acquired immunofficiency syndrome), allergies), neurological disorders (e.g. atrocke, Parkinson's disease, epileps), gastrointestinal (e.g. ulcer, cirrhosis), reproductive (e.g. endometriosis), developmental, vesicle trafficking disorders, and infections (e.g. bacterial) viral, parasitic, protozoal). These are also useful in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of UNTSIG. The INTSIG or its fragments are useful in secenting compounds for effectiveness as agonist or anteagonist of the polypeptides, or in caltering the expression of the target polymuclectide and compounds that compounds that compounds is useful in monitoring or messuring protein-protein contexactions, drug-target interactions, and gene expression profiles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ٠ <u>۵</u>

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)
amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polyuncleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
expression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I) to
polynucleotides may be used to produce the secreted (I), by inserting
the nucleic acids into a host cell and culturing the cell to express the
protein. (I) proteins and polynucleotides may be used to prevent,
diagnose and treat immune/haematopoietic-related diseases, especially
cancers and cancer metastases of haematopoietic-derived cells. AAK64703
to AAK87694 represent human immune/haematopoietic antigen genomic
sequences from the present invention. AAK49921 to AAK84950 and AAM92169
represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 11; SEQ ID NO 12322; 3071pp + Sequence Listing; English

The invention relates to isolated polymucleotide (I) and polymetrates chain readtion (FCR) primers, oligomers, and for chromosome and your chain reaction (FCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags considered the expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abbrrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and and companies. Associated for this patent did not assess biodiversity and to produce active this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity

                                                                                                                      The present sequence is rape protoporphyrinogen oxidase-1 (protox-1).

The protox-1 promoter can be used to express herbicide resistant enzymes, specifically protox, i.e. a plant tissue, plant or progeny containing a chimeric gene of the promoter and a heterologous coding sequence. The plant can also be used in breeding programmes. Also hybridising fragments of the protox coding sequence can be used as probes, e.g. to isolate related genes or for genomic
        DNA containing a plant proto-porphyrinogen oxidase gene promoter optionally linked to a heterologous gene, especially to express herbicide-resistant enzymes, and plants containing such constructs
                                                                                                                                                                                                                                                                                                                                                                                                        ..

APPLICANT: Marc J. Rubenfield et al.

APPLICANT: Marc J. Rubenfield et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: 107196.136

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT APPLICATION NUMBER: US 60/074,788

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR PILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 24374
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
